Milton B. Wise, Vice President and Vice Provost
Agricultural and Natural Resources

A.W. Snell, Acting Director
S.C. Agricultural Experiment Station

FOREWORD

It is with pleasure that the South Carolina Agricultural Statistics Service presents this 1987 edition of South Carolina Crop Statistics. The agricultural statistics in this publication include revised crop acres, yield, production and value statistics at the state and county level for 1985, and preliminary estimates for 1986. Also included are data on number of farms, land in farms, commercial fertilizer, fruit and vegetable statistics, and quarterly on and off grain stocks estimates.

This bulletin is a cooperative effort between the National Agricultural Statistics Service of the United States Department of Agriculture, and the Department of Agricultural Economics and Rural Sociology and South Carolina Agricultural Experiment Station of Clemson University. This cooperative relationship increases efficiency by avoiding duplication of effort and conflicting reports. The Federal program serves to provide comparable statistics for all states, which are released in national reports, while State funds make it possible to prepare and publish more detailed statistics for South Carolina such as those presented in this bulletin.

We are indebted to thousands of South Carolina farmers who voluntarily give their time and effort to report various information relating to their farming operation. Without this voluntary cooperation, it would be impossible to make reliable estimates or compile this publication. Thanks to all of you who assisted in this effort. In addition to the voluntary reporters, I want to publicly thank my staff for their dedication in preparing this bulletin.

Sincerely,

Henry J. Power, Jr.

Henry J. Power, Jr.
State Statistician

The South Carolina Agricultural Experiment Station is a cooperative program financed from federal and state funds. It is the policy of the Experiment Station to comply with the regulations of Title VI, the Civil Rights Act of 1964. Complaints may be filed with the Director, S.C. Agricultural Experiment Station, Clemson University, Clemson, S.C. 29631.

SOUTH CAROLINA CROP SUMMARY

1986

JANUARY: Temperatures for January were near normal for most of the month but dropped to very low readings by late month. Late January cold weather set record low levels in some locations. Rainfall during January was light and varied in amounts across the state. The month's precipitation was considerably less than normal.

Harvesting of the 1985 soybean crop continued into January with most of the crop harvested by late month. Other farming activities during January included preparation of tobacco seed beds, pruning fruit trees and repairing farm equipment. Late January cold weather caused some damage to small grains.

FEBRUARY: February temperatures were very cold early in the month but rose to above normal levels by late month. Light snowfall fell in the Upstate early in the month. Rainfall continued to be light in February with precipitation continuing to be below normal for the month and year.

Farmers were beginning land preparation for spring planting by early month and top dressing was applied to small grains. By late month tobacco beds were reported in good condition in spite of continued short rainfall. End of the month above normal temperatures had peach growers concerned that trees would begin blooming too early.

MARCH: Early month temperatures were below normal, but rose to above normal levels by mid month and remained there through the end of March. Rainfall for March was minimal and low humidities combined with high winds caused a sharp increase in forest fires in the state. A brief cold spell late in the month caused heavy frost in many areas across the state.

Top dressing of small grains continued in March with early month cold weather and persistent dry weather slowing growth. By the end of March crop planting was lagging considerably behind the previous year largely due to delays in information about government programs and short soil moisture in most areas. Corn was in fair condition as were watermelons, cantaloups and tomatoes. Tobacco beds were in good condition for the month. The warm weather was good for crops, but additional rainfall continued to be needed.

APRIL: Temperatures for April were above normal for most of the month, but weather conditions for the month were unusual. On the 24th the lowest temperature recorded for so late in the spring was broken at Greer, S.C. Three days later the same station set a new record for the highest temperature for so early in the spring. Rainfall for April continued to be minimal, with extremely dry weather causing fire hazard conditions throughout the state. Although some rainfall fell late in the month, it did not provide adequate relief to crops.

Dry weather held back planting of many crops. Corn planting was lagging behind the usual rate. Although some of the crop was being replanted due to inadequate soil moisture, corn was still in fair to good condition for most of April. Cotton planting was also slow during April with the month's condition at mostly fair. Tobacco transplanting was over two-third's complete by late month. Late month strong winds and dry weather caused tobacco stands to be poor. Peaches suffered extensive damage in the Piedmont area caused by sub-freezing temperatures on the 28th and 29th. The freeze kill was erratic, leaving some orchards without any peaches at all while in others thinning was required. The Ridge area suffered some light losses. Approximately one-third of the state's total crop was lost because of the freeze. Small grains were in desperate need of rainfall by late April.

MAY: Temperatures for May were at near seasonal levels for most of the month. Many areas of the state were incurring the worst spring drought since 1915. By mid month showers brought relief to many crops and late month localized thunderstorms helped further. Soil moisture readings improved to short by late May.

Corn planting was virtually complete by mid month and growers were applying nitrogen and layby herbicides to the crop. The condition of the crop improved by late month to fair to good. Soybean planting began by mid-May and seed germination and stands were helped considerably by the mid to late month rains. The crop had to be replanted in some areas due to late month hail damage. For May the condition was fair. Tobacco planting was virtually complete by the middle of the month. Plants were helped considerably by late month rains, and the crop was reported in fair to good condition for the month. By late month peach harvest was beginning with the crop in fair to good condition in spite of late April freeze damage and the year's dry weather. Pastures and small grains were in poor to fair condition and needed more rainfall.

JUNE: Temperatures for the month were above normal with dry weather conditions persisting throughout the month. Although there were some scattered showers across the state, soil moisture conditions were critically short. June was the beginning of one of the driest summers ever recorded for the state.

Corn deteriorated rapidly throughout the month with the condition at fair to good in early June declining to poor to fair by the end of the month. The crop was beginning to mature by late June. Soybeans were almost 90 percent planted by late month. Beans in many areas had to be replanted due to extremely dry weather conditions. Although the state condition of soybeans was mostly fair, many areas reported the crop in very poor or poor condition. Cotton was in mostly fair condition for June and was holding up better than most other crops. Squaring was over three-fourth's complete by late month. Tobacco remained fair to good in spite of very dry weather conditions. Light harvest was getting underway by late month. Peach harvest moved rapidly through June and was ahead of the usual harvesting pace. Dry weather continued to affect sizing. Harvest of peaches was almost 50 percent complete by late June with the condition reported at fair. Vegetables were in fair to good condition in spite of dry weather. Tomatoes were over one-third harvested by late month with the condition at fair. Pastures continued to deteriorate as dry weather conditions persisted. Small grain harvest was virtually complete by late month with yields being very low.

JULY: July was hot and dry with temperatures averaging 2-7 degrees above normal. Daily highs were in the low 100's and nightly lows were recorded in the mid-60's. Scattered showers were the only source of moisture for most of the month. Rain came in the form of local thunderstorms with amounts ranging from less than 2 inches in several locations. Pond levels fell rapidly due to the lack of rainfall. The lack of rainfall also critically affected most agricultural crops and related industries.

The tobacco crop was in fair condition early in the month but dropped substantially by month's end due to July's critically dry weather. Tobacco topping and harvest was slightly behind normal with some tobacco blistering due to the high temperatures. Additional rainfall was needed to fill out upper leaves. Soybean growers had virtually completed plantings the first week of July with only 6 percent of the crop left to be planted. However, the lack of rainfall left some fields stunted in a no-growth stage. Bloom and pod set ran behind normal trends for July. Cotton's condition fell and development lagged behind last year's pace due to July's hot, dry weather. Peanuts, sweetpotatoes and sorghum were in poor condition and in need of more rain to maintain normal yield potential.

Peach harvest began falling behind last year's pace due to hot, dry weather which slowed maturity. The condition was rated as poor to fair for the month. Apple harvest began the second week of July, a little later than usual. Watermelon and cantaloup harvest was winding down by the end of the month. All were in poor to fair condition. Tomato harvest was complete by the end of the month. Fall vegetable growers were waiting for an increase in soil moisture before planting their crops.

AUGUST: Early August weather continued to follow July's trend, with hot and dry conditions prevailing. Temperatures averaged above normal during the 1st half of the month but began to change by mid-month when temperatures averaged seasonal levels and at times 2-3 degrees cooler than average by the end of August. Rainfall amounts ranged from less than 3 inches to as much as 15 inches by month's end, bringing much needed relief to the state's agricultural industry. Soil moisture levels were at the critical stage early in August, but improved as rainfall came near the end of the month.

Tobacco harvesting was active during August, but growers were somewhat disappointed with the crops condition which was at poor to fair early in the month. However, as harvesting neared completion, with 85 percent of the crop out of the fields, the condition improved to fair due to adequate showers received near the end of the month. Insect pressure was reported as heavy in some areas, but control measures were being taken. Soybeans were generally poor to fair during August. By month's end rains came, and beans began to show some progress. Blooms and pods were setting in large numbers as yield potential showed signs of improving from July's drought. Although showers were adequate, they arrived too late to benefit the corn crop as yields were generally low and of poor quality. Some areas reported that major insect problems were also causing damage to the corn crop. The condition of cotton fluctuated during the month at very poor to poor and showed no signs of improving until late in the last week when slight signs were evident due to showers. Light peanut harvest got underway the last week in August. The crops quality was rated as poor to fair early in the month but improved as rain came near the end of the month.

Peach harvest was complete by the third week in August. Condition was fair, but improved to good as the harvesting season neared completion. Volumes and quality were fair. Apple harvest continued but lagged behind last year's percent harvested. Condition was fair. Watermelon and cantaloup harvest was complete by mid-August with condition poor to fair. Pecans were poor to fair, excessive nut droppage was experienced due to the drought. Fall vegetable planting got underway in late August.

Severe drought conditions continued to deteriorate pastures. Conditions were poor as water supplies dwindled for livestock. Mid-August scattered showers brought much needed relief to pastures as conditions moved up to fair. Hay improved as weather conditions became more favorable. Winter grazing planting got off to a good start in late August.

SEPTEMBER: Temperatures averaged 3 to 4 degrees below seasonal norms for most of the month with highs still approaching the 90's. End of the month temperatures ran above normal with highs reaching the mid to upper 90's. Rainfall was widespread but sporadic as mostly light to moderate showers brought temporary relief from the drought but did little to improve soil moisture.

The one crop which benefitted from the rains was soybeans. The crop was growing rapidly with early planted beans showing promise while later varieties needed additional rain to aid in maturity. Weed infestation was heavy in many fields with spraying for corn earworms and velvetbean caterpillars a general practice. Open cotton bolls were hurt considerable by rains; lowering yield prospects in some fields. Defoliation and harvest was underway by month's end while more rainfall was needed in areas having late maturing varieties. Tobacco harvest was complete and growers continued to cut stalks. Farmers were over the half way mark by the end of September. The general condition of late tobacco during September was rated as fair. Corn harvesting early in September was slowed by excessive rainfall and progressed at a slow pace until late in the month when weather conditions were permissable. Harvesting picked up the third week of September but yields were dissappointing in nearly all areas. However, a few eastern counties indicated that yields were slightly better than originally estimated. Peanuts were generally in fair condition for the month.

Apples, grapes, and pecans were fair with apple harvest progressing to a slow pace. Fall vegetable plantings continued with some active picking of cucumbers by month's end. The quality of some hay was reduced by rains after mowing, but the overall condition was fair. September's rains were favorable for pastures as they were generally reported as fair and progressing well. Winter grazing planting continued throughout the month, however, inadequate soil moisture in areas missed by showers forced some delays.

OCTOBER: Temperatures averaged 10 to 12 degrees above normal the first week of October. The remainder of month temperatures averaged near to slightly below seasonal normals. Rainfall was generally above normal at most locations as soil moisture ratings were 54 percent very short and 46 percent short at the beginning of October and by the end of the month moisture ratings improved to 11 percent very short, 56 percent short and 33 percent adequate.

Corn harvest was complete by mid-October while soybean harvest was just getting underway. Soybean yield potentials were disappointing during October as rains were too late for early maturing soybeans. The condition of soybeans was poor to fair for the month. Cotton harvest was active during the month but was interrupted several times due to showers. By month's end about 55 percent of the cotton crop was picked, considerably behind last year's 85 percent and the 5-year average of 80 percent. However, many growers delayed picking, hoping the late season rains and a late first freeze would allow them to make a "top crop." Weather conditions were favorable during October and November and final yields were considerably better than expected earlier. Peanut, sorghum and sweetpotato harvests were all lagging behind last year's pace but as the month ended, harvest was near the 2/3's mark.

Apple harvest was active during October, with quality and condition being fair to good early in October but dropped substantially near the end of the month to poor to fair. Vegetable growers were actively harvesting cucumbers and other fall vegetables. Pecan condition was fair.

Fall seeding of barley, oats and rye was near the 50 percent mark while wheat seeding had reached 20 percent by November 1. The early condition of the small grain crops was fair to good.

NOVEMBER: Temperatures during November varied from 2-4 degrees below normal and considerably above normal at times. Although, temperatures varied for most of the month, seasonal temperatures were recorded near month's end with the first hard freeze being reported in many areas. Rainfall was heavy during the month, making efforts for harvesting difficult and discouraging as the quality of unharvested crops deteriorated. Soil moisture was rated as 36 percent short and 64 percent adequate.

Wet and rainy weather conditions slowed and nearly stopped the harvesting of all crops during the month. Soybeans and cotton were greatly affected with both crops being damaged as unharvested fields deteriorated and quality and yields were reduced. Peanut harvest was also slowed, but the crop was rated as fair during the month. Sweetpotato harvest neared completion by month's end, condition was fair.

Apple harvest was complete by mid-November and fall vegetables were being harvested but also slowed due to wet conditions. Pecan harvest was slowed, condition fair.

Small grain plantings moved at a normal pace early in November but was slowed by mid-month due to heavy rains. However, the moisture and warm temperatures did benefit small grains already planted. Pastures showed signs of much improvement due to favorable weather, condition was fair to good by month's end.

DECEMBER: December temperatures averaged warmer than usual until late in the third week when they dropped to 20 degrees in some areas of the state. Rainfall amounts varied for the month, mostly heavier in the Coastal Plains. Some freezing rains were reported near the end of December in the mountains.

Small grain plantings continued during the month but excessive soil moisture delayed progress. Cotton harvest was slightly behind and was not completed before early January. Soybean harvest was 89 percent complete by late December, however some unharvested fields were abandoned as the crop continued to deteriorate. Preparations for tobacco plant beds had been completed by the end of December.

1986 VEGETABLE ACREAGE HARVESTED DOWN 10 PERCENT

South Carolina's **acreage harvested** of all vegetable and small fruit commodities produced in 1986 was 41,460 acres, down 10 percent from the 46,188 acres harvested in 1985. The 1986 harvested acreage for cucumbers for pickles and watermelons decreased 2 and 12 percent. Fresh market snap beans decreased 4 percent, while tomatoes showed a 5 percent decrease in 1986 harvested acres. Fresh market cucumbers and cantaloups showed a substantial drop in 1986 harvested acres when compared to 1985's. Acreages harvested for other commodities were mixed, with mostly decreases ranging from 29 percent to 6 percent. Increases ranged from 8 percent to as much as 50 percent. The 1986 acreage harvested for sweetpotatoes decreased by 20 percent from 1985.

South Carolina's **value** of **production** of all vegetable and small fruit commodities decreased 4 percent in 1986 from 1985's $54.8 million to $52.7 million in 1986. The value of production for the five leading commodities decreased from 1985 with the exception of watermelons, snap beans, and tomatoes. Watermelons showed a 51 percent increase with snap beans increasing by 19 percent, and tomatoes by 7 percent. Cucumbers for pickles and sweetpotatoes decreased 7 and 40 percent.

More detailed information on the 1986 Vegetable Survey is published in the "South Carolina Vegetable Statistics--AE444, April 1987."

ACREAGE, YIELD, PRODUCTION, PRICE AND VALUE OF COMMODITIES, 1986

Commodity	Acreage Planted	Acreage Harvested	Yield per Harvested Acre	Production	Average Price	Value of Production
	Acres		Cwt.	Cwt.	Dols./Cwt.	Thou. Dols.
Cucumbers for Pickles	13,400	13,300	69	915,000	9.45	8,647
Watermelons	11,100	9,200	155	1,416,790	5.74	8,136

*1/Preliminary. Beginning in 1986, the survey date changed to September 1, instead of October 1 for all stocks. 2/Per program modification: On-farm corn, wheat and sorghum grain stocks estimates discontinued. Off-farm barley and oats will be made as of June 1 each year; sorghum stocks estimates each June 1 and September 1. 3/The fourth quarter reference date for soybeans is September 1 not October 1. *Unpublished to avoid disclosing individual operations.*
